ORG: none TITLE: Selection of averaged standard pictures SOURCE: AN UkrSSR. Chitayushchiye avtomaty i raspoznavaniye obrazov (Reading devices and pattern recognition). Kiev, Naukova dumka, 1965, 138-155 TOPIC TAGS: pattern recognition, character recognition, automatic reader, data correlation ABSTRACT: A theoretical study is presented of averaged standard masks for correlation-type automatic readers (V. A. Kovalevskiy, same issue, p. 46). Correlation coefficients can be calculated either by optical or electrical correlators. In the first case, the crosscorrelation coefficient is calculated from this formula: $R_l = R_l' - R_l''$, where $R_l' = \sum_{l=1}^{l} \rho_l \frac{e_{il}}{M_l}$; $R_{l'} = \left(\sum_{l=1}^{l} \rho_l\right) \times \frac{\tilde{\epsilon}_l}{k l_l}$. Two standards are used in each channel: a normalized standard of the real character e, /M, and a "white field" Card 1/2

standard common to all channels. In the second case, the crosscorrelation coefficient is given by: $R_i = \sum_{j=0}^{N} p_j e_{j,j}^*$, $i=1,2,\ldots,m$, where p_j is the j-th component of an N-dimensional vector p which describes the picture at a given position; e_j^* ; is the j-th component of an N-dimensional vector e_j^* which describes the i-th normalized and neutralized standard. Formulas are developed for the optimum standards, which minimize the error probability, for both above cases. When the total number of black elements in the standard is great, the use of the first type standard (optical) yields a much lower error probability. A "hybrid" circuit is recommended for practical automatic readers. Orig. art. has: 2 figures and 56 formulas.

TITLE: The synthesis of optimum weight functions of distributed controls in technological plant control systems

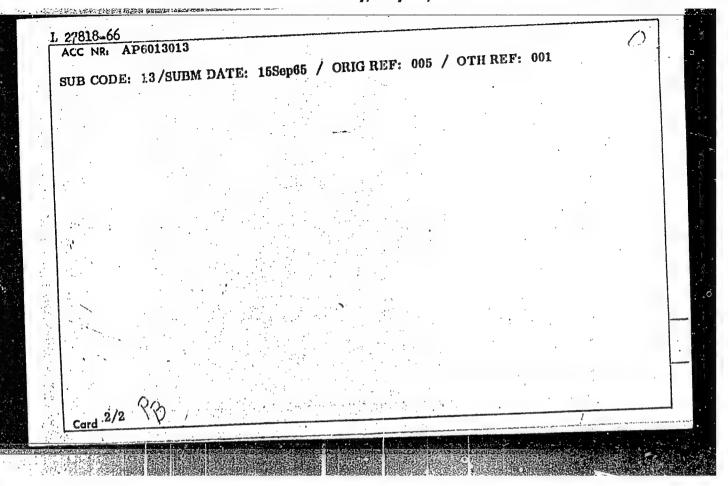

SOURCE: Avtometriya, no. 1, 1966, 83-95

TOPIC TAGS: industrial automation, optimum control, functional equation, functional

ABSTRACT: Utilizing the methods of functional analysis, the author carries out the determination of the optimum weight function for the distributed control of a unidimensionally distributed technological process. The discussion is carried out for an internal problem usually encountered in chemical technology plants which are characterized by continuous interaction of two moving media brought into contact (heat and mass transfer devices using direct or counterflow). Following the establishment of pertinent partial differential equations and their extensive theoretical analysis, the paper develops methods for the numerical solution of the problem and concludes with a presentation of the results of calculations of the optimum weight function on the M-20 computer. These results can be used directly in the design of new control The author expresses his sincere gratitude to Dr. of Technological Sciences B. N. Devyatov for useful advice and discussions. for cold and hot water, reagents, gas, and compressed air, as well as with a device for removing the solid and liquid decay products (to a container for solid decay products, to canals, or to a LHO (KZhO) liquid-decay product container). The combined two-stage +k (FK) filter has the following characteristics: filtering surface, 0.25 m², maximum output, 36 m3/hr, resistance of the filter with maximum output, 40 mm water column, efficiency with maximum output, 99.9%, output after repeating the exchange of the chamber air 30 times, 12 m3/hr, resistance at an output of 12 m3/hr, 12 mm water column, efficiency at an output of 12 m3/hr, 99.99%, dimensions 435.160.170 mm, weight 4 kg. The 3k-LT (3K-ST) chamber differs from 3K-NZh only in that, instead of stainless steel, simple carbon steel with anticorrosive coating had been used. The 5 - + - (5K-NZh) chamber is similar to 3K-NZh but has two seats (two pairs of gloves, two observation windows, same components and equipment as 3K-NZh). The length is 2250 mm, content 0.8 m3. The 5k-cr (5K-ST) chamber corresponds to 5K-NZh, consists, however, of carbon steel with anticorrosive coating. The $6 \, \text{k}$ (6K) chamber is a desk chamber with gloves for work with α and β active substances (content 0.15 m3, weight 40 kg, length 100 mm, width 600 mm, height 600 mm). It has a detachable observation window (250.600 mm),

PERIODICAL:

Zhurnal neorganicheskoy khimii: 1958, Vol 3, Nr 7, pp 1644-1649

(USSR)

ABSTRACT:

The exchange system Na, Rb || CH₃COO, NO₃ was investigated by the visual polythermal method. First the two-component systems CH₃COONa-CH₃COORb and CH₃COORb-RbNO₃ were investigated. In the system CH₃COONa-CH₃COORb an incongruent compound is formed (formula CH₃.COONa.3CH₃COORb) with a melting point at 180° C. In the second system a congruent compound (formula RbNO₃.2CH₃COORb) with a melting point at 202° C is formed. Rubidium acetate, like lithium acetate, sodium- and potassium acetate, has two polymorphous modifications with a point of transformation at 215° C.

Card 1/2 of

The melting point of rubidium acetate is increased in the presence of other salts from 236°C to 300°C. There are 3 figures,

TITLE: Dense continuous cultivation of Chlorella under various illumination conditions

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy kosmicheskoy biologii, v. 4, 1965, 683-686

TOPIC TAGS: Chlorella, photosynthesis, biosynthesis, plant growth, light absorption, light biologic effect

ABSTRACT: Experiments were performed with a thermophylic strain of Chlorella vulgaris in order to determine optimal lighting conditions for high concentrations of cells during intensive, continuous cultivation. Concentrations of 2×10^9 , 3×10^9 , and 4×10^9 cells per cc were used. This is equivalent to 20, 30, and 40 g of the dry biomass per liter of suspension. The algae

Card 1/4

L 11255-66

ACC NR: AT6003908

were cultivated in a flat culture vessel with a working capacity of 1.4 liters, a dark capacity of 0.25 liters, and a total working surface of 0.6 m². During the course of the experiment the temperature was held at 36.5 \pm 0.7° C, the pH was 7.35 \pm 0.4, and the thickness of the layer was 5 mm. Air containing 5% CO₂ was bubbled through the culture medium.

Previous experiments had determined that in a culture containing 30 g of dry weight of biomass per liter, an optical path 0.5 mm long through the suspension absorbed about 90% of all photosynthetically active white-light radiation. This meant that bubbling played an important role in creating consecutive light and dark phases for each cell. The mm-thick layer of culture was equally illuminated from both sides by gas-discharge lamps (DRL-1000 and ND-2), which produced favorable illumination for photosynthesis. In the experiments, 6 levels of illumination intensity were used, ranging from 0.260 up to 1.202 cal/cm²/min. As a rule the light intensity was changed from minimum to maximum and then back to minimum. The duration of such a cycle was usually 4 to 5 hours. Deviations from the selected level of intensity did not exceed ± 4%. The duration of the experiments was 6 days.

Card 2/h

L 14255-66

ACC NR: AT6003908

The effect of various intensities of illumination on the growth of the algae was based on the increase in the weight of the biomass expressed in grams of dry substance per liter of suspension per diem. In all cases the intensity of production tended to increase with the intensity of illumination up to a certain point. After that, additional increases in illumination failed to bring about additional increases in productivity. The leveling-off point was reached at different light intensities, ranging from 0.361 cal/cm²/min for low-density cultures (20 g/liter) to 0.791 cal/cm²/min for high-density cultures (43 g/liter). It is interesting to note that the productivity for different densities was also most identical: ranging from 36—38 g of dry weight per liter of suspension per diem.

The almost identical maximum productivity of the various cultures may be explained by the fact that high concentrations of cells make the medium optically very dense. When the thickness of the culture layer is fixed, the average level of illumination of the cells becomes a function of surface illumination and culture density. The light falling on the cells, along with the productivity of individual cells, drops rapidly as culture density increases. It was found that the intensity of biosynthesis of cells at 20 g/liter is nearly

The Preside-Tyloric Sunutium of the Resected Stomach."

Budapess, Mayyar Radiologia, Vol XV, Nr 1, Jan 1963, pages 14-22.

Abstract: [Anthor's English summary modified] After stomeon resection the remaining part of the stomach and the adjoining loop of the small intestine forms a pylorus-like mechanism, a few months after the operation, which regulates the evacuation of the stowach to a certain degree. This regulatory mechanism can be influenced by drugs as well as by physica-chemical attach in the mucous membrane. After testing on over 100 patients, the author concludes that the functioning of the shape to make can be influenced by the composition of the foca at well. I hundrate: , I western references.

1122. GIMES R. A Budapesti Orvostudományi Egyetem I. sz. női Klinikájának Közleménye. * Tuberculoticus elváltozások endometriosisban. Tuberculous changes in endometriosis MAG. NÖORV. LAPJA 1954, 17/4 (245-

Simultaneous occurrence of to and endometriosis is rare. A tuberculous process in the musculature of the uterus often gives rise to destruction of the endometriotic tissue. In the near vicinity of the primary tubercle, endometriosis is always demonstrable, but in cases of extensive cascation only the to is visible. A personal case is reported, in which the heterotopic endometrium in the uterine muscle was only observed in the vicinity of the small to foci. Endometrial tissue was mostly absent around the large caseous foci. Thus, extensive to changes may mask the picture of primary endometriosis. This may lead to the erroneous opinion that a picture of primary endometriosis. This may lead to the erroneous opinion that a picture of a primary endometriosis. The pre-to process in the myometrium may also occur without endometriosis. The pre-to process in the myometrium may also occur without endometriosis. "The Role of Listeriosis in the Etiology of Spontaneous Abortus."

Budapest, Orvosi Hetilap, Vol 104, No 26, 30 June 63, pages 1210-1212.

Abstract: [Authors! Hungarian summary] Bacteriological and serological tests for listeriosis were made by the authors on 115 patients who had spontaneous abortus. Agglutination and complement binding titer values, characteristic for listeriosis, were found in 2 cases. For further investigation of the frequency of listeriosis, tests on larger groups of patients and investigations aimed at the culturing of the causative agent are necessary. 2 Eastern European, 6 Western references.

EMF(t)/EMP(b) IJP(c) JD/JG L 1182-66 ACCESSION NR: AT5025157 HU/2502/64/042/004/0343/0349 AUTHOR: Beck, Hihaly T. (Bek, M. T.)(Doctor)(Szeged); Gimesi, Istvan (Gimeshi, I.) TITLE: Effect of the ligand on the activation of molecular hydrogen by monovalent silver ions Academia scientiarum hungaricae. Acta chimica, v. 42, no. 4, 1964, 343-349 SOURCE: TOPIC TAGS: fluoride, fon, silver, hydrogen, carbon monoxide, polarization ABSTRACT: Fluoride ions significantly enhanced the reaction of monovalent silver with molecular hydrogen or with carbon monoxide. The effect was explained by the concerted action of the central ion and the ligand. In considering the steric conditions it must be assumed that the fluoride ion exerts its polarizing effect through a hydrogen bridge by inserting a water molecule between the fluoride and the hydrogen. On the basis of the activation effect, the stability constant of monofluoro-silver (I) complex was determined. Orig. art. has 11 formules, 3 graphs, and 2 tables. Card 1/2
